

## Exhibit A

### **1. Discussion of contracts; not readily susceptible to manipulation**

- The interest rate swap (IRS) market is considered the largest derivative market in the world, with an estimated \$441 trillion in notional principal outstanding as of December 2012 according to the Bank for International Settlements. See BIS Quarterly Review, September 2013 Page A10 Table 4 [http://www.bis.org/publ/qtrpdf/r\\_qs1309.pdf](http://www.bis.org/publ/qtrpdf/r_qs1309.pdf).
- IRS are cash-settled so there is no deliverable supply to be manipulated. IRS are widely used by corporations, insurance companies, banks, and governments to transfer and manage interest rate risk. TradSEF believes that the size and liquidity of the cash market for interest rate linked financial instruments, such as bonds, loans, government interest bearing instruments and volume of trading of swaps and interest rate sensitive instruments creates in each case significant liquidity in interest rate sensitive instruments so as to render IRS not easily susceptible to manipulation. Furthermore, IRS-associated interest rate futures contracts, loans, cleared swaps, cash and futures markets for government debt securities offer a deep liquidity pool to hedge and risk-manage swaps based on such rates indexes.
- TradSEF will monitor trading in these swaps in conjunction with TradSEF's regulatory service provider. TradSEF has a comprehensive surveillance program and rules to prevent TradSEF participants from engaging in manipulative activity and possesses discretion to impose fines and disciplinary sanctions on its participants. Furthermore, TradSEF's predecessor brokers who are involved in the operation of TradSEF have decades of experience in operating platforms and executing trades in these swaps.

### **2. Discussion of Index Reference Prices**

- Index Selection: TradSEF limits the indexes underlying its interest rate swap offerings to well-established, publicly available third-party interest rate market benchmarks. Some are published by central banks, others, such as the London Interbank Offered Rate (LIBOR) benchmark, are calculated and published by reliable independent providers such as trade associations, exchanges or other third parties. The interest rate reference prices underlying swaps on TradSEF are the timeliest, most widely recognized and reliable benchmarks for interest rates in their respective markets. The index levels are readily available and commercially acceptable as benchmarks for borrowers, lenders, investors, portfolio managers, governments and public policy makers.
- As a result of the widely publicized allegations that certain individuals attempted to manipulate LIBOR indexes in particular, ICE Benchmark Administration (IBA) officially took over as the administrator of the London Interbank Offered Rate (LIBOR) from February 1, 2014. IBA is regulated by the UK Financial Conduct Authority (FCA), which has confirmed formal authorization to IBA to administer LIBOR. IBA has built a robust oversight and governance framework that includes an independent board with a majority of Independent Non-Executive Directors. The Oversight Committee, which will administer the LIBOR code of conduct, shall be composed of benchmark users, independent experts, benchmark submitters, the IBA board and other stakeholders. IBA's new surveillance methodology has been designed to adjust to changing market

conditions and it will employ sophisticated analytical tools to operate the benchmark price setting process with transparency. ICE will implement a new post-publication surveillance system and tests designed to assess the credibility of LIBOR submissions and rates. Thomson Reuters will collect data and perform real-time surveillance and calculation services under the oversight of ICE. LIBOR Methodology: Each day major banks submit their cost of borrowing unsecured funds for 15 periods of time in 10 currencies. Thomson Reuters audits the data submitted by panel banks and creates the rates using the definitions provided by BBA's FX & MM Committee. The LIBOR rate produced by Thomson Reuters is calculated by using a trimmed arithmetic mean. Thomson Reuters receives each bank's submissions, ranks them in descending order and then drops the top and bottom quartiles. The middle two quartiles, reflecting 50% of the quotes, are then averaged to create the LIBOR quote. The bottom and top quartiles are dropped from the calculation in order to increase the accuracy of the LIBOR quotes. Dropping the outliers is done to limit the ability of any one bank to influence the calculation and affect the LIBOR quote. LIBOR reference prices are calculated daily. All of the recent public scrutiny and changes mentioned above to the administration of LIBOR make it difficult for an attempt by a single market participant or group or market participants to manipulate the LIBOR reference price.

- TradSEF believes that the large number of participants in each market, and the calculation of each index by well known, independent third parties further limits the susceptibility of manipulation of these indexes. TradSEF believes that such benchmark indexes, many of which also underlie liquid interest rate futures contracts on major Designated Contract Markets, due to the large number of index participants, ubiquity, and broad-market nature are not readily susceptible to manipulation.

## 5. General Specifications (unless stated otherwise in the relevant product descriptions):

### Overview

An IRS is where two parties agree to exchange interest rate cash flows, based on a specified notional amount from a fixed rate to a floating rate (or vice versa) or from one floating rate to another for a predetermined term. There are three types of IRS:

#### 1. Fixed / Floating

One party pays a fixed rate for the term of the IRS at specific intervals such as monthly, quarterly, semi-annually or annually. The other party will make floating rate payments indexed to reference rates such as 3 month LIBOR. Generally fixed and floating rate payments are compounded and paid net on the longer coupon date. Note that fixed rate payments can be made on several different day count conventions. Money Market = No. of Days / 365; Bond Basis = 30 /360 Fixed; Adjusted Bond Basis = Actual No. of Days / 365 or 366.

#### 2. Basis Swap

One party pays a floating rate for the term of the IRS indexed to a floating reference rate. The other party will also pay a floating rate indexed to a reference rate in a different tenor. For example a 2 year term IRS, Party A pays 6m \$ LIBOR, Party B pays 3m \$ LIBOR. Generally payments of the 3m \$LIBOR will be compounded and offset on the coupon dates.

#### 3. Overnight Index Swap

A Fixed / Floating IRS where the floating rate is an overnight rate compounded and offset against the fixed rate payments and dates.

In general, the floating rate can be almost any kind of index fixed asset price, but in the OTC markets, the focus is on interest rate instruments, including but not limited to:

- Deposit indices such as Libor, Euribor etc
- Constant Maturity indices, e.g., 5Y IRS
- Inflation indices, e.g., UK RPI, French HICP, US CPI

**Interest Rate Options****Overview**

An interest rate option grants the buyer the right, but not the obligation, to either enter into an underlying instrument (payers or receivers swaption - usually cash settled at expiry) or a series of pay-offs based upon future index fixings (cap/floor). Exercise of this option is dependent upon the strike price agreed at the time of the original contract being "in the money" at expiry, i.e. higher than the fixing rate for a receivers swaption or floor (puts), lower for a payers swaption or cap (calls).
